Question 1

Correct

Marked out of 3.00

▼ Flag question

Write a program that determines the name of a shape from its number of sides. Read the number of sides from the user and then report the appropriate name as part of a meaningful message. Your program should support shapes with anywhere from 3 up to (and including) 10 sides. If a number of sides outside of this range is entered then your program should display an appropriate error message.

Sample Input 1

3

Sample Output 1

Triangle

Sample Input 2

Heptagon Sample Input 3 11 Sample Output 3 The number of sides is not supported. **Answer:** (penalty regime: 0 %) 1 #include<stdio.h> 2 v int main(){ 3 int sides; 4 scanf("%d",&sides); 5 if(sides==3) 6 printf("Triangle\n"); 7 else if(sides==4) 8 printf("quadrilateral\n"); 9 else if(sides==5) 10 printf("Pentagon\n"); 11 else if(sides==6) 12 printf("Hexagon"); 13 else if(sides==7) 14 printf("Heptagon"); 15 | else if(sides==8) 16 printf("Octagon");

Sample Output 2

17 else if (sides==9)
18 printf("Nonagon");
19 else if (sides==10)

```
23 | return 0; }
```

	Input	Expected	Got	
~	3	Triangle	Triangle	~
~	7	Heptagon	Heptagon	~
~	11	The number of sides is not supported.	The number of sides is not supported.	~

Question ${\bf 2}$

Correct

Marked out of 5.00

▼ Flag question

The Chinese zodiac assigns animals to years in a 12-year cycle. One 12-year cycle is shown in the table below. The pattern repeats from there, with 2012 being another year of the Dragon, and 1999 being another year of the Hare.

Year	Animal
2000	Dragon
2001	Snake
2002	Horse
2003	Sheep
2004	Monkey

2007	Pig	
2008	Rat	
2009	Ox	
2010	Tiger	
2011	Hare	
with that yea	ram that reads a year from the user and displays the animal associated ar. Your program should work correctly for any year greater than or equal just the ones listed in the table.	
Sample Inpu	t 1	
2004		
Sample Outp	out 1	
Monkey		
Sample Inpu	t 2	
2010		
Sample Outp	out 2	
Tiger		

```
Answer: (penaity regime: 0 %)
  1 #include<stdio.h>
   2 int main()
   3 ₹ {
          int year;
          scanf("%d",&year);
          char*animals[]={"Dragon", "Snake", "Horse", "Sheep", "Monkey", "Roos
          printf("%s\n",animals[(year-2000)%12]);
  7
          return 0;
  9 }
```

	Input	Expected	Got	
~	2004	Monkey	Monkey	~
~	2010	Tiger	Tiger	~

Question $\bf 3$

Correct

r riag question

Write a program that reads a position from the user. Use an if statement to determine if the column begins with a black square or a white square. Then use modular arithmetic to report the color of the square in that row. For example, if the user enters a1 then your program should report that the square is black. If the user enters d5 then your program should report that the square is white. Your program may assume that a valid position will always be entered. It does not need to perform any error checking.

Sample Input 1

a 1

Sample Output 1

The square is black.

Sample Input 2

Sample Output 2

The square is white.

Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
2 v int main(){
       char col;
3
       int row;
       scanf("%c%d",&col,&row);
       printf("The square is %s.\n",((col-'a')+(row-1))%2==0?"black":"
7
8
       return 0;
9
```

Inpu		Input	Expected	Got	
	~	a 1	The square is black.	The square is black.	~
